Abstract

The purpose of this project is to develop an interactive online computer based job-searching system to support and speed up the procedures in searching various job opportunities submitted by various companies.

The main goal is to provide easy way for job searching over the web. Any person can register in the web site and after that he can submit his resume, search for jobs by his preference (by qualification, location, preferred salary etc.), to apply for jobs of his selection etc. Any company can register in the recruiter module and after that they can submit job vacancies, search for suitable job seekers, to view the applicants and their resume etc.

Nowadays so many similar websites are there, one issue is that only when we apply for a job we find out that the qualification criteria is not met and we could not apply for the same. In order to avoid it, this job portal will only display the jobs which the user can apply according to the qualification that user registered in his/her profile. Also this project aims to provide the information about various institutions which provide these courses so that in case a user like to take those courses to improve his/her skills then they can get it easily.

Technologies Used:

Php, Html, CSS, Javascript, Mysql.

Modules

- User Module
- Company Module
- Admin Module

User Module:

- User Login
- User Registration
- Resume Submission
- View Resume

- Searching for jobs
- Applying for jobs

<u>Company Module:</u>

- Company Login
- Recruiter Registration
- Searching Users(Job Seekers)
- Viewing Applicants
- Vacancy Submission

<u>Admin Module:</u>

- Edit Users/Recruiters
- Delete Users/Recruiters
